

A SUPERIOR PRODUCT THAT LIVES UP TO ITS PROMISE!

CHECK VITAMIN D LEVELS

You will confirm that Maximum D3[®] works!

LOADING

The most common regimen for loading and initial follow up with Maximum D3[®]:

- Serum 25(OH)D <18-20 ng/ml: **1 capsule daily for 30 days, then 2 capsules weekly**
- Serum 25(OH)D >20 ng/ml: **2 capsules weekly**
- Then reassess 25 (OH)D levels after 12 weeks.

These recommendations apply only to Maximum D3[®].

DESIRABLE LEVELS

The ideal range is generally between 30 and 60ng/ml of 25(OH) cholecalciferol.

It is generally recognized that the minimal blood level needed to prevent overt bone disease is 20 ng/ml.

Good evidence exists for a risk of overt bone disease (osteomalacia, Rickets) with levels below 20 ng/ml. There is decent evidence for suboptimal calcium absorption with levels below 32 ng/ml. Primitive sun exposed populations have 25(OH)D levels predominantly in the 40-60 ng/ml range.

Toxicity from short term exposure requires levels near or above 150 ng/ml. Studies to assess the long-term safety of levels from 80 to 150 ng/ml are lacking. The Institute of Medicine recommends against doses averaging above 4,000 IU/day in unsupervised patients. The above recommendation is based on lack of evidence for additional benefit, limited data for adverse effect and uncertainty over toxicity from chronic use.
